

DUAL GRIPPER ADAPTER

Two Grippers In One Minimize Machine Wait Time During Part Reloading

A dual gripper allows you to speed up your production by using two grippers in one. This allows you to reduce machine wait time during part reloading, which can greatly reduce cycle time. With the OB7 Dual Gripper, you can unload a completed part then immediately reload a new part, eliminating the extra trip to and from the machine. The Dual Gripper Adapter is compatible with the OB7 Parallel Electric Gripper and grippers that use the standard ISO mount toolplate.

Note: Grippers not included.

In lathe operations, which generally have short cycle times requiring an operator to constantly wait for the machine, using a dual gripper frees up time and allows the operator to focus on preparing other jobs and parts.

A dual gripper allows you to improve your workflow and production by reducing wait time and increasing productivity.
